

I would appreciate a proactive, self-motivated team, but I understand the start may be hard. To begin, I will follow up by email and meet you in person (online) only when needed.

The first step is to clearly identify and settle on 3 specific contributions for this work. For now, your contributions are:

- 1- Boundary loss function
- 2- Skip gates architecture
- 3- Cross-dataset evaluation and 4-phase ablation study

In principle, those look good to me. But in practice, you did not complete any of them to reach a publication level.

So, what I want you to do over the next week is to perform an in-depth literature survey **focused on those specific contributions**, not the general inpainting problem.

- 1- Identify the gaps that exist in the literature for each of those three contributions.
- 2- Show which ones of those gaps each contribution is expected to fill.
- 3- Explain how each contribution will fill the gaps it is intended to fill.

When this is clear in your mind, write the corresponding abstract, introduction and literature survey sections directly in the paper. We may refine them a little after we see the results. That is perfectly fine. But let's have a draft paper first, which will serve as a plan or "agreement" that binds you to follow over the coming period until you submit.

TODO

So next week, send me an email with the findings of your specific literature survey. The week after, integrate it with your existing literature survey in the Overleaf project you will share with me.
